                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           at
       The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the wild-type human Apo-2 ligand amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               , Arg or

```
The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence polypeptide, comprising 282 amino acids and having another polypeptide sequence comprising 282 amino acids and having cone or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence.

Note: The variant sequence that is referred to in claim 10 may contain one or more of the potential substitutions highlighted in the features table for this record.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to apoptosis inducing molecule-I protein (AIM-I) comprising sequence that is 70 % identical to ADJ63976 or its mature for where the polypeptide binds antibody specific to AIM-I, induces apoptosic of cells. Also included are a composition comprising AIM-1 and a carrier, alm. I produced by a process involving expressing in a host cell a nucleic acid that encodes the protein so as to produce the protein (where the nucleic acid is chosen from a polynucleotide encoding AIM-1, mature AIM-1, mature/AIM-1 except for 1-5 or 5-10 conservative amino acid substitutions, the amino acid sequence encoded by human cDNA contained is ATCC Deposit No. 97448, and a polynucleotide that is complementary to polynucleotide which hybridises at 60degreesC in a hybridisation buffer consisting of 0.5 % SSC (Saline-Sodium Citrate) and 0.1 % sodium dodecyl mature/AIM-1, and a polynucleotide chosen from polynucleotide encoding mature/AIM-1, and a polynucleotide encoding amino acid sequence encoded by human cDNA contained in ATCC Deposit No. 97448, where the polynucleotide encodes a polypeptide that has the same biological activity as described above). AIM-1 is useful for treating lyanged cell stimulating peripheral tolerance, destroying pathologic transformed cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            at is complementary to

lines, mediating cell activation and proliferation. AIM-1 proteins are functionally linked as primary mediators of immune regulation and inflammatory response, are useful for diagnosis and treatment of disorders of cells, tissues and organisms. AIM-1 is useful as research tool in elucidating biology of autoimmune disorders including systemic lupus erythematosus, immunoproliferative disease lymphadenopathy and is useful for inhibiting neoplasia such as tumour cell growth. AIM-1 is also useful to treat diseases which required growth promotion activity e.g., restenosis. AIM-1 is useful for assessing AIM-I binding capacity of its binding molecules such as receptor molecules. The present sequence

                                                                                       preventing
                                             The invention relates to antibodies specific to apoptosis inducing molecule-I (AIM-I) polypeptides. The invention is useful in research, biological, diagnostic, clinical or therapeutic applications. It is also used for modulating activation and differentiation of cells, both normally and in disease states, or for mediating apoptosis and preventing or treating autoimmune diseases, graft-versus-host disease or lymphadenopathy. The invention is also useful in gene therapy. The present sequence is human AIM-I protein.
                                                                                                                                                                                                 9

The invention relates to a new purified tumour necrosis factor related apoptosis inducing ligand (TRAIL) polypeptide comprising an amino acid sequence that is at least 90% identical to human TRAIL (ADK15498) or mouse TRAIL (ADK15502). The TRAIL polypeptide induces apoptosis of Jurkat cells. Also included are a purified human TRAIL polypeptide encoded by the cDNA insert of the recombinant vector deposited in strain ATCC 69849 or a fragment of human TRAIL protein of SEQ ID NO: 2 that induces apoptosis of Jurkat cells), a fusion protein comprising a leucine zipper opptide and a soluble TRAIL polypeptide (comprising the extracellular comprising at least two soluble TRAIL polypeptides (or at least two soluble TRAIL polypeptide is useful in studies of an oligomer defined above). The TRAIL polypeptide is useful in studies of apoptosis, in regulating programmed cell death, for treating leukaemia, cancer (e.g. colorectal cancer) or viral infections, or in purifying cancer (e.g. colorectal cancer) or viral infections, or in purifying cucance development. The TRAIL polypeptide may also be used in developing treatments for any disorder mediated by defective or insufficient amounts of TRAIL. The present sequence represents human TRAIT.
                                                                                                                                                                                                                                                                           New tumor necrosis factor related apoptosis inducing ligand polypeptides useful in studies of apoptosis, in regulating programmed cell death, or for treating leukemia, cancer (e.g. colorectal cancer) or viral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to apoptosis inducing molecule I (AIM-I) polypeptide and the encoding polynucleotide useful in biological, diagnostic, clinical and therapeutic arts. The invention is useful in treating autoimmune disorders such as systemic lupus erythematosus, immunoproliferative disease lymphadenopathy (IPL), angioimmunoproliferative lymphadenopathy (AIL), rheumatoid arthritis, diabetes and multiple sclerosis, graft versus host disease, lymphoproliferative disease such as lymphadenopathy, in inhibiting neoplasia such as tumour cell growth, in treating restenosis and regulating haematopoiesis in endothelial cell development. The invention is useful in chromosome identification and as a diagnostic marker for determining expression of AIM-I polypeptide in tumour cell lymphoma. The including pancreatic tumour, endometrial tumour and T-cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

or diseases associated with the NF-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, an inflammatory disorder, cancer, aberrant apoptosis, related to aberrant NF-kappaB regulation, cancer, aberrant apoptosis, hepatic disorders, Hodgkin's lymphomas, haematopoietic tumours, hyper-IgM syndromes, hypohidrotic ectodermal dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTIV-1, hepatitis B, hepatitis C, EBV, influenza, viral replication, host cell survival, evasion of immune responses, rheumatoid arthritis, inflammatory bowel disease, colitis, asthma, atherosclerosis, cachexia, euthyroid sick syndrome, stroke, EAE, autoimmune disorders, disorders related to hyper immune activity, disorders related to aberrant acute phase responses, hypercongenital conditions, birth defects, necrotic lesions, wounds, organ transplant rejection, conditions related to organ transplant rejection, disorders related to aberrant signal transduction, proliferating disorders, cancers and HIV propagation in cells infected with other viruses. The present sequence is that of a human protein which is subject to the novel association with the NF-kappaB pathway of the invention. Note: This sequence does not appear in the specification but

The present invention describes an antibody or its fragment comprising a VH and VL domain that is at least 80% identical to a VH and a VL domain that is at least 80% identical to a VH and a VL domain of an antibody expressed by any one of the cell lines contained in American Type Culture Collection (ATCC) Deposit numbers PTA-3571, PTA-3570 and PTA-3675, where the antibody specifically binds TR4 (TRAIL receptor). Also described is a pharmaceutical composition for treating or preventing haematological cancer, comprising the antibody or its fragment and a member selected from ibritumomab tiuxetan, imatinib mesylate, cortostatic activity, and can be used in immunotherapy. The antibody or its fragment can be used for the preparation of a pharmaceutical composition for treating or preventing haematological cancer, e.g. Nonthodykin's lymphoma, chronic myelogenous lymphoma, multiple myeloma, or chronic lymphocytic leukaemia. The present sequence represents human tumour necrosis factor (TNF) related apoptosis-inducing ligand (TRAIL), which is used in the exemplification of the present invention.

This invention relates to a novel method of inhibiting or treating a tumour, metastasis or infectious lesion in a subject which comprises administering into or near a site of a tumour or infectious lesion in a subject an antigen presenting cell and an immunostimulatory cytokine or a nucleic acid encoding the cytokine. The invention may be useful for the production of compounds with a cytostatic or vulnerary activity acting as immunomodulators. The method is useful in inhibiting or treating a tumour, metastasis or infectious lesion in a subject, where the size of tumour, metastasis (where number is also decreased) or infectious the tumour, metastasis (where number is also decreased) or infectious concerinoma, colorectal cancer, basal cell cancer, oral cancer, nead and neck cancer, renal cell cancer, pancreatic cancer, pulmonary cancer, cervical cancer, ovarian cancer, oesophageal cancer, gastric cancer, prostrate cancer, testicular cancer and breast cancer. The present sequence is that

The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its complement. The nucleic acids encode cancersesociated proteins. Also included are an expression vector comprising the above recombinant nucleic acid crexpression vector, a microarray for detecting a cancer-associated caid cited above, a host cell comprising the above a cancer-associated (CA) nucleic acid comprising at least one probe comprising at least 10 contiguous nucleotides of any of the above mentioned nucleotide sequences, an isolated polypeptide (encoded within an open reading frame of a A sequence selected from any of the 35 polynucleotide sequences as mentioned in the specification, or its opportunity in isolated antibody, (or its antigen binding fragment) that binds to the above polypeptide, a hybridoma that produces the above monoclonal antibody, a pharmaceutical composition comprising the above monoclonal antibody, a pharmaceutical excipient, a kit for detecting cancer cells comprising the above monoclonal antibody, a pharmaceutical excipient, a kit for detecting cancer cells in an individual, an electronic library comprising the above polypeptide (or their fragments), methods for diagnosing cancer cells in an individual, an electronic library comprising the above polymetotide or polypeptide (or their fragments), methods of sortening for anticancer activity or for a bloactive agent capable of modulating the associated with expression of a polypeptide in a test cell sample, a method for treating cancers and a method for inhibiting the expression of a sectivity or a carrivity or for a bloactive agent capable of modulating chargement associated with expression of a polypeptide in a test cell sample. CA gene in a call with a method for treating cancers and a method for inhibiting cancer. The present sequence is a human CAP cancer. The present sequence is a human CAP cancer of the printed sequence data for this patent din or form pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated cancer-associated polynucleotides and polypeptides usef
for diagnosing, preventing or treating cancers, especially lymphoma
leukemia, or in screening for agents that modulate cancer.

of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, invenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease mellitus, immune-mediated renal disease, a demyelinating polyneuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, bilary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitis, enteropathy, whipple's disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, asthma, allergic rhinitis, atopic dermatitis, poortasis, of the lung, cosinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein of the invention.

SUBUNIT: Homotrimer (Potential).

SUBCELLULAR LOCATION: Type II membrane protein (Probable).

TISSUE SPECIFICITY: Specifically expressed in endothelial cells.

Detected in placenta, lung, kidney, skeletal muscle, pancreas, spleen, prostate, small intestine and colon.

SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                an

FUNCTION: Cytokine that binds to TNFRSF3/LTBR. Binding to the decoy receptor TNFRSF6B modulates its effects. Activates NFKB, stimulates the proliferation of T cells, and inhibits growth of the adenocarcinoma HT-29. Acts as a receptor for Herpes simplex
                                                                                                                                                                                                                                                        ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTM: N-glycosylated.
PTM: The soluble form of isoform 1 derives from tby proteolytic processing.
SIMILARITY: Belongs to the tumor necrosis factor CAUTION: Ref.5 sequence differs from that shown dframeshift in position 178.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                INDUCTION: Up-regulated after T-cell activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Event=Alternative splicing; Named isoforms=2;

"Mouse LIGHT; molecular genetics, ligand binding and expression at LIGHT; molecular genetics, ligand binding to Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Cytokine that binds to TNFRSF3/LTBR. Binding to decoy receptor TNFRSF6B modulates its effects. Activates N stimulates the proliferation of T cells.
stimulates the proliferation of T cells.
-!- SUBUNIT: Homotrimer (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                       similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing.

SIMILARITY: Belongs to the tumor necrosis factor family
                                                                        Kitamura T.;
a mouse homolog

LONA 5:149-156(1986).

-I- FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-!- SUBUNIT: Homotrimer (By similarity).

-!- SUBCELULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

-!- PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

-!- PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (By initialization).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention provides one kind of mutant 95-281 recombinant soluble polypeptide (rsTRAILthr95gly-281) in human TRAIl extracellular region. The preparation process and antineoplastic application of the recombinant soluble polypeptide are also provided. The present sequence represents human TRAI-1 extracellular region. Chinese. 1; 15pp; ID NO 187 AA; Claim 1; SEQ Sequence

ligand antineoplastic

factor relative cell death inducing on mutation polypeptide, used for an

New tumor necrosis fa extracellular region application.

                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a cell factor derivative (TRAIL) as an anticancer derivative. The TRAIL protein can be expressed soluble form in bacterial cytoplasm. The present sequence repres TRAILD amino acid sequence. Recombinant TRAILD fusion proteins cused in anti-cancer medicaments to treat cancer of the liver, brikidney. It can also be used to treat leukaemia

The present invention relates to the isolation of cDNA encoding human tummour related apoptosis inducing ligand (Trail), and the Trail protein. The Trail full length cDNA is cloned, and is utilised to create a Trail prokaryotic expression system. The full length Trail cDNA is used to respectively clone cDNA of soluble ectocytic segment Trail109 and Trail 114, and respectively create Trail109 cDNA and Trail114 cDNA prokaryotic expression systems. The prokaryotic expression systems created greatly increase the expression and quantity of the Trail, Trail109, and Trail114 proteins, and may be useful in a new preparation for killing tummour cells. The present sequence represents the partial human Trail protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

This invention relates to an expression vector containing the tumour necrosis factor related apoptosis inducing ligand (TRAIL) protein receptor SDRS. The invention also comprises a method for producing the receptor SDRS. The invention also comprises a method for producing the sDRS protein from an E. coli transformed with the vector. The method of the invention is useful for crystallising the recombinant proteins i.e. proteins with improved stability or cytotoxic activity of a TRAIL protein which involves changing the amino acid of the AA loop to increase the various interactions between amino acids or from the binding site of metal ions or the disulfide bonding, or changing the corresponding amino acids of the homotrimer interface or homodimer interface to increase the various interactions between amino acids or from the binding site of metal ion or disulfide bond, or to fill the cavity. A 3 dimensional structure of the TRAIL-SDRS complex is useful for the molecular strategy conferring specificity for the recognition between TNF family members and TNF receptor family members and for the development of TRAIL protein, which has a better stable, cytotoxic activity or an improved receptor binding affinity. The present sequence represents the human tumour cerosis factor receptor apoptosis including ligand (TRAIL) protein sequence used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                135

                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                            The present invention relates to the isolation of cDNA encoding human tummour related apoptosis inducing ligand (Trail), and the Trail protein. The Trail full length cDNA is cloned, and is utilised to create a Trail prokaryotic expression system. The full length Trail cDNA is used to respectively clone cDNA of soluble ectocytic segment Trail109 and Trail 114, and respectively create Trail109 cDNA and Trail114 cDNA prokaryotic expression systems. The prokaryotic expression systems created greatly increase the expression and quantity of the Trail, Trail109, and Trail114 proteins, and may be useful in a new preparation for killing tummour cells. The present sequence represents the partial human Trail protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 137
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAB08265-83 represent tumour necrosis factor (TNF) ligands. The specification describes an AGP-3 polypeptide, which is TNF ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, e.g. rheumatoid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

                                                                                                                                                                                     The invention relates to a TNF-related apoptosis-inducing ligand (TRAIL) cDNA and its encoded polypeptide. The gene of the inventirelated to mutational human tumour necrosin. The polypeptide of tinvention is useful for inducing the death of tumour cells. The sequence represents the TRAIL amino acid sequence

The present invention relates to Tumour necrosis factor (TNF) and Apolrelated Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, proteins (including homologues), and their antibodies. The invention in particular relates to methods for regulating the interaction between TALL-1 and TALL-1 receptors (BCMA referred as B cell maturation factor) to regulate monocyte, macrophage and B lymphocyte mediated immune responses. TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rheumatoid arthritis, systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       erythematosus (SLE), insulin dependent diabetes mellitus, multiple sclerosis, myasthenia gravis, Grave's disease, autoimmune haemolytic anaemia, autoimmune thrombocytopenia purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephritis, or polyarteritis nodosa. The TALL-1 protein and its corresponding nucleic acid sequence are also useful in diagnostic assays. The present sequence is a C-terminal region of human TRAIL protein. which has 20-25% sequence identity with the C-terminal region of human TALL-1 protein extracellular domain. TRAIL protein is a TNF family member
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       83 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG
